COINBOUND

Collect every coin. Unlock the portal. Challenge the final boss.

1 Title + pitch

Coinbound is a compact mobile platformer in which a small explorer collects coins, crosses hazards, opens portals and defeats a two-phase boss.

2 Genre + platform

Single-player action platformer for Android, landscape left/right. Short levels and large touch controls support brief mobile play sessions.

3 2D presentation

A side-view 2D game using sprites, Rigidbody2D physics and a following camera. Existing uploaded levels and characters form the starting point.

4 Core loop

MOVE > JUMP / SHOOT > COLLECT > REACH THE PORTAL > REPEAT

Coins unlock each level exit. The last arena replaces the exit objective with defeating the boss. Failure leads to a quick restart.

5 Controls

Bottom-left stick: move left/right. Bottom-right JUMP: jump from the ground. FIRE: shoot in the facing direction; holding repeats at the selected cooldown.

Top-right PAUSE: freeze the game. RESUME, RESTART and MAIN MENU control the pause screen. Desktop: A/D or arrows, Space/W/Up, X, Escape.

6 Content

Two platforming levels plus one boss arena. One patrol-enemy type and one boss with fan and rain attacks. Objects: coins, health pickups, spikes/fire hazards, moving platforms and portals. Screens: menu, HUD, pause, death and victory.

COINBOUND

A deliberately small scope, with one system added each week.

7 Art + sound

Use the uploaded pixel tiles and characters consistently. UI uses dark teal plates, cream text, mint controls and gold accents; music and effects come from the existing project.

Source status: builder comments identify Kenney tiles, but exact pack links and audio licenses need student verification. Liberation Sans includes its OFL license. No unverified attribution is claimed.

8 Minimum viable product - week 15

Two levels and a boss arena; movement, jumping and cooldown shooting; coins, health, hazards and win/lose states; functional menu, HUD and pause; safe-area-aware landscape touch controls; an Android build tested on a real phone.

Weekly additions planned: basic progress/settings saving, balanced enemy behaviour, consistent audio and readable visual feedback.

9 Cut list

No multiplayer, open world, inventory, crafting, procedural generation, online accounts, in-app purchases or large level editor. No additional characters or worlds before the current scope works.

10 Plan - weeks 9 to 13

W9: adapt existing game, mobile controls, safe area, three UI screens, GDD and repository.

W10: review patrol AI and two-phase boss; tune difficulty and attack warnings.

W11: refine two levels and arena; add basic progress/settings saving.

W12: balance music/effects levels; verify feedback for coins, damage and victory.

W13: add restrained effects; fix layouts, performance and regressions on phones.

+ Ownership + acceptance

Individual work through week 13: the student owns code, design, interface, assets and release preparation. Teams form in week 14 according to the assignment.

Acceptance: test menu > level > pause on 16:9, a notch phone and a 4:3 tablet; verify physical multitouch; submit five screenshots, this PDF, GitHub evidence and a narrated English MP4. AI assistance is disclosed in AI_LOG.txt.
